3 Introduction

Decomposing a system into modules is a commonly accepted approach to developing software. A module is a work assignment for a programmer or programming team (Parnas et al., 1984). We advocate a decomposition based on the principle of information hiding (Parnas, 1972). This principle supports design for change, because the “secrets” that each module hides represent likely future changes. Design for change is valuable in SC, where modifications are frequent, especially during initial development as the solution space is explored.

Our design follows the rules laid out by Parnas et al. (1984), as follows:

- System details that are likely to change independently should be the secrets of separate modules.
- Each data structure is implemented in only one module.
- Any other program that requires information stored in a module’s data structures must obtain it by calling access programs belonging to that module.

After completing the first stage of the design, the Software Requirements Specification (SRS), the Module Guide (MG) is developed (Parnas et al., 1984). The MG specifies the modular structure of the system and is intended to allow both designers and maintainers to easily identify the parts of the software. The potential readers of this document are as follows:

- New project members: This document can be a guide for a new project member to easily understand the overall structure and quickly find the relevant modules they are searching for.
- Maintainers: The hierarchical structure of the module guide improves the maintainers’ understanding when they need to make changes to the system. It is important for a maintainer to update the relevant sections of the document after changes have been made.
- Designers: Once the module guide has been written, it can be used to check for consistency, feasibility, and flexibility. Designers can verify the system in various ways, such as consistency among modules, feasibility of the decomposition, and flexibility of the design.

The rest of the document is organized as follows. Section 4 lists the anticipated and unlikely changes of the software requirements. Section 5 summarizes the module decomposition that was constructed according to the likely changes. Section 6 specifies the connections between the software requirements and the modules. Section 7 gives a detailed description of the modules. Section 8 includes two traceability matrices. One checks the completeness of the design against the requirements provided in the SRS. The other shows the relation between anticipated changes and the modules. Section 9 describes the use relation between modules.

4 Anticipated and Unlikely Changes

This section lists possible changes to the system. According to the likeliness of the change, the possible changes are classified into two categories. Anticipated changes are listed in Section 4.1, and unlikely changes are listed in Section 4.2.

4.1 Anticipated Changes

Anticipated changes are the source of the information that is to be hidden inside the modules. Ideally, changing one of the anticipated changes will only require changing the one module that hides the associated decision. The approach adapted here is called design for change.

AC1: The supported languages for the assessments (e.g., adding languages like Spanish, French, etc.).

AC2: The types of assessments supported (e.g., addition of new assessment types like sentence completion, story-telling, etc.).

4.2 Unlikely Changes

The module design should be as general as possible. However, a general system is more complex. Sometimes this complexity is not necessary. Fixing some design decisions at the system architecture stage can simplify the software design. If these decision should later need to be changed, then many parts of the design will potentially need to be modified. Hence, it is not intended that these decisions will be changed.

UC1: Input/Output devices (Input: File and/or Keyboard, Output: File, Memory, and/or Screen).

UC2: The core structure and design of the question bank system.

UC3: The primary purpose of the system, which is to assist parents in administering speech assessments for bilingual children.

5 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 1. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

M1: Clinician GUI Module

M3: App Controller Module

M2: Parent GUI Module

M4: API Gateway Module

M5: Authentication Module	M12: Video Processing Module
M6: Result Storage Module	M13: Audio Processing Module
M7: Media Processing Module	M14: English Question Bank Module
M8: Logging Module	M15: Mandarin Question Bank Module
M9: Question Bank Module	M16: Matching Question Bank Module
M10: Real-Time Feedback Module	M17: Repetition Question Bank Module
M11: Report Generation Module

Behaviour-Hiding	Clinician GUI Parent GUI Authentication Module Result Storage Module Real-Time Feedback Module Report Generation Module Media Processing Module Video Processing Module Audio Processing Module Logging Module Question Bank Module Mandarian Question Bank English Question Bank Repetition Question Bank Module Matching Question Bacnk Module
Software Decision	APP Controller API Gateway

Table 1: Module Hierarchy

6 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the SRS. In this stage, the system is decomposed into modules. The connection between requirements and modules is listed in Table 2.

[The intention of this section is to document decisions that are made “between” the requirements and the design. To satisfy some requirements, design decisions need to be made. Rather than make these decisions implicit, they are explicitly recorded here. For instance, if a program has security requirements, a specific design decision may be made to satisfy those requirements with a password. —SS]

7 Module Decomposition

Modules are decomposed according to the principle of “information hiding” proposed by Parnas et al. (1984). The *Secrets* field in a module decomposition is a brief statement of the design decision hidden by the module. The *Services* field specifies *what* the module will do without documenting *how* to do it. For each module, a suggestion for the implementing software is given under the *Implemented By* title. If the entry is *OS*, this means that the module is provided by the operating system or by standard programming language libraries. *Software Engineering* means the module will be implemented by the Software Engineering software.

Only the leaf modules in the hierarchy have to be implemented. If a dash (–) is shown, this means that the module is not a leaf and will not have to be implemented.

7.1 Hardware Hiding Modules (M??)

N/A

7.2 Behaviour-Hiding Module

7.2.1 Clinician GUI (M1)

Secrets: The interactive and visual components that allow Clinicians to interact with the system, through the App Controller (M3), to access patient data and information, and make informed decisions.

Services: To show application functionality to clinicians, accepting user inputs (choosing assessments to review, flagging bias questions) and displaying outputs (assessment summaries).

Implemented By: [Your Program Name Here]

Type of Module: Library

7.2.2 Parent GUI (M2)

Secrets: The interactive and visual components that allow Parents to interact with the system, through the App Controller (M3), to setup and engage in the assessment with their child.

Services: To show application functionality to parents, accepting user inputs (selecting answers to questions, completing setup) and displaying outputs (question visuals, button selections).

Implemented By: [Your Program Name Here]

Type of Module: Library

7.2.3 Authentication Module (M5)

Secrets: The data structures and algorithms used to securely store, validate, and manage user credentials.

Services: Provides user registration, login, and session management services. Ensures authentication for all system users (parents, clinicians, and admins) to maintain system security.

Implemented By: AuthenticationService

Type of Module: Library, Abstract Data Type

7.2.4 Result Storage Module (M6)

Secrets: The schema and mechanisms used to store, index, and retrieve assessment results and metadata efficiently.

Services: Manages the storage and retrieval of processed media flags, assessment results, and associated metadata. Ensures data security and organization to support reporting and feedback functionalities.

Implemented By: ResultStorageService

Type of Module: Record, Abstract Object

7.2.5 Media Processing Module (M7)

Secrets: The design and implementation of how media (video and audio) is processed in the system.

Services: Provides high-level functionality for media processing by delegating tasks to its submodules: Video Processing Module and Audio Processing Module. Acts as an abstraction layer for handling media data.

Implemented By: Media-processing-service

Type of Module: Abstract Object

7.2.6 Logging Module (M8)

Secrets: The design and implementation of log storage and retrieval mechanisms, as well as the structure of the logs (e.g., event logs, error logs, debug logs).

Services: Tracks system activity and errors through event logging. Supports audit logging for user actions and system changes. Provides interfaces to query and clear logs for maintenance.

Implemented By: logging-monitoring-service

Type of Module: List of Records

7.2.7 Question Bank Module (M9)

Secrets: Integrates and manages question bank submodules, provides logic for selecting and instructing the appropriate submodule.

Services: Acts as a facade to provide unified access to all question banks. This module handles requests for retrieving, adding, updating, or delegating questions to appropriate submodules.

Implemented By: QuestionBankService

Type of Module: Abstract Object

7.2.8 Real-Time Feedback Module (M10)

Secrets: The data pipeline and algorithms used to process live media streams and generate immediate feedback.

Services: Provides real-time analysis of audio and video streams during an assessment session. Flags issues or disturbances and delivers immediate feedback to guide session adjustments.

Implemented By: RealTimeFeedbackService

Type of Module: Library

7.2.9 Report Generation Module (M11)

Secrets: The methods and templates used to compile data into user-friendly reports summarizing session results and flagged disturbances.

Services: Generates comprehensive session reports for review by parents and clinicians. Summarizes processed media results, flagged disturbances, and overall session feedback.

Implemented By: ReportGenerationService

Type of Module: Library

7.2.10 Video Processing Module (M12)

Secrets: The methods and algorithms used to process video data, including frame extraction, format handling, and metadata processing.

Services: Handles all video-related data processing tasks, such as analyzing video frames, ensuring quality, and extracting relevant details. This module communicates with the Media Processing Module.

Implemented By: Media-processing-service

Type of Module: Abstract Object

7.2.11 Audio Processing Module (M13)

Secrets: The methods and algorithms used to process audio data, such as format conversions, noise filtering, and speech analysis.

Services: Handles all audio-related data processing tasks, including speech detection, sound quality analysis, and extracting key audio features. This module communicates with the Media Processing Module.

Implemented By: Media-processing-service

Type of Module: Abstract Object

7.2.12 English Question Bank Module (M14)

Secrets: The format for storing, tagging and/or indexing English questions

Services: Converts the input data into the data structure used by the input parameters module.

Implemented By: EnglishQuestionManager

Type of Module: Abstract Data Type

7.2.13 Mandarin Question Bank Module (M15)

Secrets: The format and structure of the input data.

Services: Converts the input data into the data structure used by the input parameters module.

Implemented By: MandarinQuestionManager

Type of Module: Abstract Data Type

7.2.14 Matching Question Bank Module (M16)

Secrets: The format and structure of the input data.

Services: Converts the input data into the data structure used by the input parameters module.

Implemented By: MatchingQuestionService

Type of Module: Library

7.2.15 Repetition Question Bank Module (M17)

Secrets: The format and structure of the input data.

Services: Converts the input data into the data structure used by the input parameters module.

Implemented By: MatchingQuestionService

Type of Module: Library

7.3 Software Decision Module

7.3.1 AppController Module (M3)

Secrets: The interactions between the GUIs (M1, M2) and the API Gateway (M4), acting as a means to interface with the software modules.

Services: Enables the user to pass information from the GUIs to the backend services.

Implemented By: [Your Program Name Here]

Type of Module: Library

7.3.2 API Gateway Module (M4)

Secrets: The interactions between the App Controller (M3) and the inter-dependencies of all other software modules, including inherited modules (M6, M7, M8, M9, M10, M11, M13, M14, M15, M16, M17).

Services: Enables the user to access the system and interact with its components, consisting of the Patient, Client, and Admin views.

Implemented By: [Your Program Name Here]

Type of Module: Library

8 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes.

9 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. Parnas (1978) said of two programs A and B that A *uses* B if correct execution of B may be necessary for A to complete the task described in its specification. That is, A *uses* B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.

[The uses relation is not a data flow diagram. In the code there will often be an import statement in module A when it directly uses module B. Module B provides the services that module A needs. The code for module A needs to be able to see these services (hence the import statement). Since the uses relation is transitive, there is a use relation without an import, but the arrows in the diagram typically correspond to the presence of import statement. —SS]

[If module A uses module B, the arrow is directed from A to B. —SS]

Figure 1: Use hierarchy among modules

10 User Interfaces

[Design of user interface for software and hardware. Attach an appendix if needed. Drawings, Sketches, Figma —SS]

The interfaces below depicts the interface allowing a user who enters the application to either login to the platform if they have an existing account, or create a new account for new users.

Figure 2: Login or Create an Account

The interfaces below depicts the flow of selecting which account type to create. If a parent account is chosen, they are able to create a username and password and enter client number to complete the account creation. A clinician account information will be created and provided to the clinician by the admin.

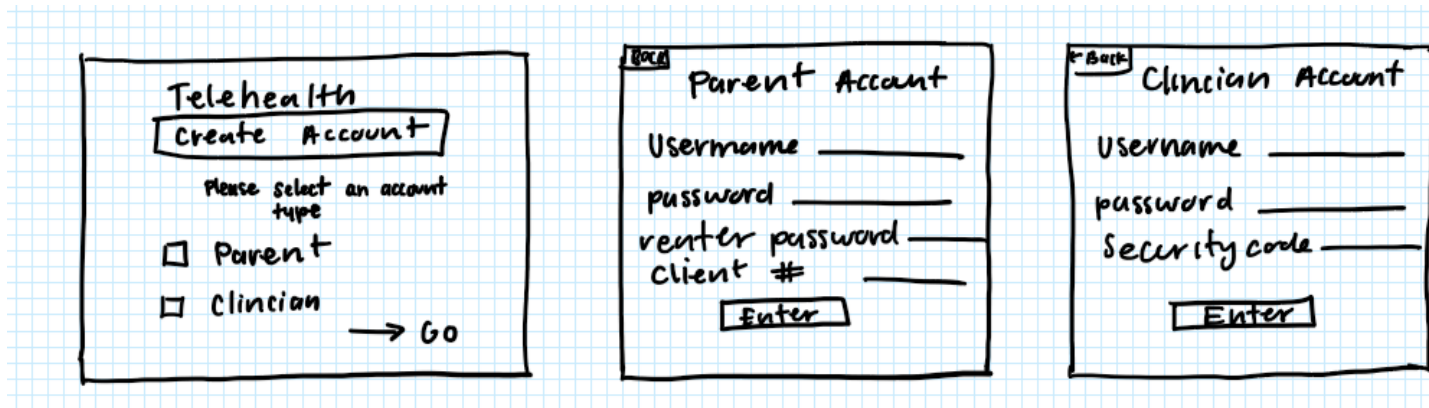

Figure 3: Create an Account

The interface below depicts the login page overview, where a user can login to the application if they already have an existing account.

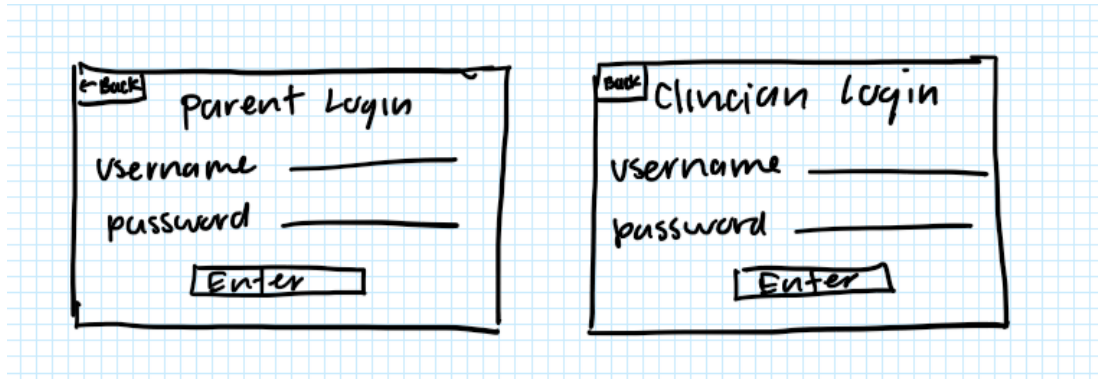

Figure 4: Login in to account

The interface below depicts the home page for the parent to enter the assesement platform. The home page provides options to learn how to use the assessment platform or start the assessment.

Figure 5: Parent HomePage

The below finite state machine depicts how the parent can interface with the home-page, as well as which interactions lead to changes in states in the system for logging in/out with authentication.
